The time period for reply, if any, is set in the attached communication.

## Office Action Summary

Application No.

10/004,458

Applicant(s)

FUNG ET AL.

Examiner

Jeffrey D. Popham

Art Unit

2137

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

### Status

- 1) ☒ Responsive to communication(s) filed on 03 May 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

### Disposition of Claims

- 4) ☒ Claim(s) 1-4,6-18 and 20-26 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-4,6-18 and 20-26 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 01 September 2005 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

***Remarks***

Claims 1-4, 6-18, and 20-26 are pending.

***Continued Examination Under 37 CFR 1.114***

1. A request for continued examination under 37 CFR 1.114, including the fee set forth in 37 CFR 1.17(e), was filed in this application after final rejection. Since this application is eligible for continued examination under 37 CFR 1.114, and the fee set forth in 37 CFR 1.17(e) has been timely paid, the finality of the previous Office action has been withdrawn pursuant to 37 CFR 1.114. Applicant's submission filed on 5/3/2007 has been entered.

***Response to Arguments***

2. Applicant's arguments filed 5/3/2007 have been fully considered but they are not persuasive.

Applicant argues that Nakaya does not teach moving the second interrupt indicator associated with the younger control record onto the first interrupt indicator associated with the older control record if processing of the second data completes before processing of the first data. First, what needs to be determined is what being a "younger control record" actually means. Younger cannot mean that the control record is processed after the older control record, since the claims explicitly state the possibility of processing of the younger data first. Therefore, the youngness of the control record must be specified by some form of order or sequence of the control records. One

Art Unit: 2137

possibility is to use the sequence in which the control records are received. If processing of the control records were to be performed on a single sequential processor, the order in which that processor would process the records may be used as a determination of youngness. A simple ordering of the control records in any form can show the youngness of a record.

Nakaya explicitly teaches the use of older and younger control records within parallel processing. This can be seen, for example, in Figure 7 of Nakaya, where U1 is the oldest instruction in the set, with U2 being a younger instruction than U1, U3 being a younger instruction than U2 and U1, etc. One set of parallel computable parts is U2 through U6, each one in that sequence (from U2 to U6) being younger than the previous part. The cited portions (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12) show how this processing occurs, in that each serial computing part is processed serially in regard to other instructions, while the parallel computable parts are processed with multiple parallel processors. An interrupt for any parallel computing part will not be issued until all of the multiple parallel computable parts (e.g. U2 through U6) are finished processing.

Applicant argues that the engine can keep track of all control records currently being processed and delay any interrupt generation until all control records have been processed. From the above discussion, it is unambiguously clear that Nakaya teaches such processing and interrupt handling.

Art Unit: 2137

As further evidence of moving interrupt indicators and delaying the generation of interrupts, new grounds of rejection have been set forth in addition to the previous grounds of rejection.

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1, 3, 4, 8, and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Blaner (U.S. Patent 5,003,462).

Regarding Claim 1,

Blaner discloses a method for processing data using a plurality of processing engines, the method comprising:

Processing first data associated with an older control record in a first processing engine (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30);

Enabling a first interrupt indicator in the older control record when the processing of the first data is completed (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30);

Processing second data associated with a younger control record in a second processing engine (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30);

Enabling a second interrupt indicator in the younger control record when the processing of the second data is completed (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30); and

Moving the second interrupt indicator associated with the younger control record onto the first interrupt indicator associated with the older control record if processing of the second data completes before processing of the first data (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

Regarding Claim 3,

Blaner discloses that moving the second interrupt indicator comprises determining that the second interrupt indicator is enabled (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

Regarding Claim 4,

Blaner discloses that moving the second interrupt indicator comprises delaying the generation of an interrupt associated with the younger control record (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

Regarding Claim 8,

Blaner discloses that the older control record comprises a reference to data (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

Regarding Claim 9,

Blaner discloses that the older control record comprises a reference to an operation to be performed on data (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

4. Claim 2 is rejected under 35 U.S.C. 103(a) as being unpatentable over Blaner in view of Pierson (Pierson et al., "Context-Agile Encryption for High Speed Communication Networks", Computer Communications Review, Association for Computing Machinery, Vol. 29, No. 1, January 1999, pp. 35-49).

Blaner does not explicitly disclose that the first processing engine is a public key engine.

Pierson, however, discloses that the first processing engine is a public key engine (Pages 46-48, Section 5.2). It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the cryptographic system of Pierson into the interrupt sequencing and reporting system of Blaner in order to allow the system to perform encryption and authentication quickly and easily, encrypting multiple communications (with different keys, algorithms, etc.) at a time without the normal delay required for context switching.

5. Claims 6, 7, and 10-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Blaner in view of Yamaura (U.S. Patent 6,175,890).

Regarding Claim 6,

Blaner may not explicitly disclose that moving the second interrupt indicator comprises setting the second interrupt indicator associated with the younger control record to disabled.

Yamaura, however, discloses that moving the second interrupt indicator comprises setting the second interrupt indicator associated with the younger control record to disabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10). It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the interrupt masking system of Yamaura into the interrupt sequencing and reporting system of Blaner in order to efficiently save and restore data to be communicated to an external processor.

Regarding Claim 7,

Blaner as modified by Yamaura discloses the method of claim 6, in addition, Blaner discloses that moving the second interrupt indicator further comprises setting the first interrupt indicator associated with the older control record to enabled (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

Regarding Claim 10,

Blaner may not explicitly disclose writing processed data to memory associated with a host.

Yamaura, however, discloses writing processed data to memory associated with a host (Column 4, line 59 to Column 5, line 49). It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the interrupt masking system of Yamaura into the interrupt sequencing and reporting system of Blaner in order to efficiently save and restore data to be communicated to an external processor.

Regarding Claim 11,

Blaner as modified by Yamaura discloses the method of claim 10, in addition, Blaner discloses that the processing engines are coupled to an interrupt handler (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30) and Yamaura discloses that the external processor is coupled to the interrupt handler (Figure 1).

Regarding Claim 12,

Blaner as modified by Yamaura discloses the method of claim 11, in addition, Blaner discloses that the processing engines are coupled to a scheduler (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30) and Yamaura discloses that the external processor is coupled to the scheduler (Figure 1).

Regarding Claim 13,

Blaner as modified by Yamaura discloses the method of claim 12, in addition, Blaner discloses generating an interrupt when processing of the older control record has been completed (Column 5, line 41 to Column 6, line 44; and Column 8, line 62 to Column 9, line 30).

Regarding Claim 14,

Blaner as modified by Yamaura discloses the method of claim 13, in addition, Yamaura discloses that the external processor reads the processed data when the interrupt is generated (Column 4, line 59 to Column 5, line 49):

6. Claims 1, 3, 4, and 6-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nakaya (U.S. Patent 5,978,830) in view of Yamaura.

Regarding Claim 1,

Nakaya discloses a method for processing data using a plurality of processing engines, the method comprising:

Processing first data associated with an older control record in a first processing engine (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

Issuing a first interrupt indicator (termination notice) when the processing of the first data is completed (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

Processing second data associated with a younger control record in a second processing engine (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

Issuing a second interrupt indicator (termination notice) when the processing of the second data is completed (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12); and

Moving the second interrupt indicator associated with the younger control record onto the first interrupt indicator associated with the older control record if processing of the second data completes before processing of the first data (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

But does not disclose the enablement of a first interrupt indicator in the older control record or a second interrupt indicator in the younger control record.

Yamaura, however, discloses enabling a first interrupt indicator associated with the older control record (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10); and

Enabling a second interrupt indicator associated with the younger control record (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Where the interrupt indicator is placed, whether it be in a register devoted to interrupt indicators and their associations to control records or

within the control record itself, is of no significance to this method, since placing the interrupt indicator within the control record does not provide an advantage over using a register to store the indicator.

It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the interrupt handling method of Yamaura into the parallel job schedule system of Nakaya in order to efficiently restore data to be communicated to an external processor.

Regarding Claim 3,

Nakaya as modified by Yamaura discloses the method of claim 1, in addition Yamaura discloses that moving the second interrupt indicator comprises determining that the second interrupt indicator is enabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Throughout this action, when the moving (or collapsing) of interrupt indicators is cited as being in Yamaura, it is to be understood that Yamaura teaches the foundations of how it is done, via the enabling and disabling of interrupt indicators within the interrupt controller, while the portion of Nakaya cited above discloses the moving of interrupt indicators (not issuing an interrupt until termination notices from all of the processors are issued).

Regarding Claim 4,

Nakaya as modified by Yamaura discloses the method of claim 1, in addition, Nakaya discloses that moving the second interrupt indicator

Art Unit: 2137

comprises delaying the generation of an interrupt associated with the younger control record (Column 25, lines 40-63). The termination notices are issued at all of the processors before any one of the processors can generate the interrupt.

Regarding Claim 6,

Nakaya as modified by Yamaura discloses the method of claim 4, in addition, Yamaura discloses that moving the second interrupt indicator comprises setting the second interrupt indicator associated with the younger control record to disabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Regarding Claim 7,

Nakaya as modified by Yamaura discloses the method of claim 6, in addition, Yamaura discloses that moving the second interrupt indicator further comprises setting the first interrupt indicator associated with the older control record to enabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Regarding Claim 8,

Nakaya as modified by Yamaura discloses the method of claim 1, in addition, Nakaya discloses that the older control record comprises a reference to data (Column 12, lines 13-29).

Regarding Claim 9,

Nakaya as modified by Yamaura discloses the method of claim 8, in addition, Nakaya discloses that the older control record comprises a reference to an operation to be performed on data (Column 12, lines 13-29).

Regarding Claim 10,

Nakaya as modified by Yamaura discloses the method of claim 1, in addition, Yamaura discloses writing processed data to memory associated with a host (Column 4, line 59 to Column 5, line 49).

Regarding Claim 11,

Nakaya as modified by Yamaura discloses the method of claim 10, in addition, Nakaya discloses that the processing engines are coupled to the interrupt controller (Figure 1); and Yamaura discloses that the external processor is coupled to the interrupt controller (Figure 1).

Regarding Claim 12,

Nakaya as modified by Yamaura discloses the method of claim 11, in addition, Nakaya discloses that the interrupt controller is coupled to the processing engines through a scheduler (synchronizer) (Figure 1).

Regarding Claim 13,

Nakaya as modified by Yamaura discloses the method of claim 12, in addition, Nakaya discloses generating an interrupt when processing of the older control record has been completed (Column 25, line 40 to Column 26, line 12).

Regarding Claim 14,

Nakaya as modified by Yamaura discloses the method of claim 13, in addition, Yamaura discloses that the external processor reads the processed data when the interrupt is generated (Column 4, line 59 to Column 5, line 49).

7. Claims 2, 15-18, and 20-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nakaya in view of Yamaura, further in view of Pierson.

Regarding Claim 2,

Nakaya in view of Yamaura does not disclose that the first processing engine is a public key engine.

Pierson, however, discloses that the first processing engine is a public key engine (Pages 46-48, Section 5.2). It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the cryptographic system of Pierson into the parallel job scheduling system of Nakaya as modified by Yamaura in order to allow the system to perform encryption and authentication quickly and easily, encrypting multiple communications (with different keys, algorithms, etc.) at a time without the normal delay required for context switching.

Regarding Claim 15,

Nakaya discloses an apparatus, comprising:

A first processing engine configured to receive a first control record (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

A second processing engine configured to receive a second control record (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

A history buffer (interrupt controller/synchronizer) containing information associated with the first and second control records including a first interrupt indicator associated with the first control record and a second interrupt indicator associated with the second control record (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12),

Wherein the history buffer is configured to move the first interrupt indicator associated with the first control record onto a second interrupt indicator associated with the second control record if processing of the first control record completes before processing of the second control record (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12);

But does not disclose that the apparatus is a cryptography accelerator; or an interface coupled to an external processor and memory associated with the external processor.

Yamaura, however, discloses an interface coupled to an external processor and memory associated with the external processor; the interface being coupled to the processing engines as well (Column 1, lines

12-30; Column 4, line 59 to Column 5, line 10; and Figure 1). It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the interrupt handling method of Yamaura into the parallel job schedule system of Nakaya in order to efficiently restore data to be communicated to an external processor.

Pierson discloses that the apparatus is a cryptography accelerator (Pages 46-48, Section 5.2). It would have been obvious to one of ordinary skill in the art at the time of applicant's invention to incorporate the cryptographic system of Pierson into the parallel job scheduling system of Nakaya as modified by Yamaura in order to allow the system to perform encryption and authentication quickly and easily, encrypting multiple communications (with different keys, algorithms, etc.) at a time without the normal delay required for context switching.

Regarding Claim 16,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 15, in addition, Pierson discloses that the first processing engine is a public key engine (Pages 46-48, Section 5.2).

Regarding Claim 17,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 15, in addition, Nakaya discloses that the history buffer is configured to collapse the first interrupt indicator associated with the first control record onto the second interrupt indicator associated with the

Art Unit: 2137

second control record (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12), and Yamaura discloses that this is performed when the first interrupt indicator is enabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Regarding Claim 18,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 17, in addition, Nakaya discloses that collapsing the first interrupt indicator associated with the first control record onto the second control record further comprises delaying the generation of an interrupt associated with the first control record (Column 12, lines 10-62; and Column 25, line 40 to Column 26, line 12).

Regarding Claim 20,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 18, in addition, Yamaura discloses that collapsing the first interrupt indicator associated with the first control record onto the second control record further comprises setting the first interrupt indicator associated with the first control record to disabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Regarding Claim 21,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 20, in addition, Yamaura discloses that collapsing the first interrupt indicator associated with the first control record onto the

second control record further comprises setting the second interrupt indicator associated with the second control record to enabled (Column 1, lines 12-30; and Column 4, line 59 to Column 5, line 10).

Regarding Claim 22,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 15, in addition, Nakaya discloses that the second control record comprises a reference to data (Column 12, lines 13-29).

Regarding Claim 23,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 22, in addition, Nakaya discloses that the second control record comprises a reference to an operation to be performed on data (Column 12, lines 13-29).

Regarding Claim 24,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 23, in addition, Nakaya discloses that the external processor is coupled to the processing engines through a scheduler (synchronizer) (Figure 1).

Regarding Claim 25,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 24, in addition, Nakaya discloses that an interrupt is generated when processing of the second control record has been completed (Column 25, line 40 to Column 26, line 12).

Art Unit: 2137

Regarding Claim 26,

Nakaya as modified by Yamaura and Pierson discloses the apparatus of claim 25, in addition, Yamaura discloses that the external processor reads the processed data when the interrupt is generated (Column 4, line 59 to Column 5, line 49).

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Ngai (U.S. Patent 5,121,488):
